
Joomla 1.5

Posted by pbolger - 2008/02/03 21:18

Just downloaded and installed this moolet, but no action . I'm running Joomla 1.5. Do the moolets work with 1.5 yet?
Also, is there a list here of incompatible JS libs?

We have plans to bring them to to 1.5 soon but there has been such little interest so far.

As a rule of thumb you should never mix JS frameworks such as mooTools and JQuery. Most of the template makers these days have all gone to MooTools 1.1 so there should be little conflict in that area.

I just happen to be about to develop a whole lot of small sites, and 1.5 stable has just come out. Maybe I'm being a little rash, but I think it's probably going to be easier to start with 1.5 rather than do the lot in 1.13 or whatever and then convert them.

Only problem is that very few extensions seem to really work in 1.5 yet. It'd be nice if Joomla were to promote a '1.5 verified' scheme for extensions so developers could have something to work towards.

Any news on that?

Joomla 1.5 is a stable version nowadays and many users have it installed.

Hope you can do something :) Also a moo Shoutbox will be nice :)
