
Plopets problem with tab content

Posted by alterna - 2008/08/02 12:23

Hello

I need some help

I have started to design a page using ploplets on my sobi2 directory which goes fine.

However in the tabbed content which has to appear last (logo class with a simple ploplet) I have three tabs, the first one is a short one appearing correctly, but the second one contains jomcomment comments for the item and I have problems with this one.

When the pages appears correctly with the ploplet activated, I cannot view the full content of my second tab with is limited only to the size of the first one

But if I reload on the second tab, it appears correctly but all my bottom is then pushed very far at the bottom when I activate the first or third tab

is there any solution to solve this ?

I am a beginner in all this B)

Please find attached my page

Thanks <http://www.moolets.com/images/fbfiles/files/sobi2.zip>

Hello.

Can you install the attachement on your server and send us a URL?

thanks

I have modified a little the template and it's a bit better

However is there a way to hide the title and the stars before they appear ?

They first appear, then disappear then reappear with effect

I have installed on the beta server and will leave it open for a few hours at <http://beta.icontes.com>

It's in french so you have to go to the page "enregistrez" and choose a story "la baignade" for instance ;)

By the way I tried to installed the module moolet online lite, but no way, each time, blank screen on the page where it was installed and activated, so I forgot but if you have any clue

Thanks already and come to visit us <http://www.moolets.com/images/fbfiles/files/sobi2-22d8ade821e4ac59c7854f6374a713d4.zip>

I guess I got there to late as it is gone. Without being able to hit that actual liver server with Firebug to see what the error

is there is nothing I can do.

Each server will have a different error.
