
moolets logo

Posted by armybot - 2007/11/06 10:40

Hi, I just installed you interesting module.

FYI I noticed that during the loading process the moolets logo image url is pointing to the subdir of the module (and it works).

Finished the loading step, during normal visualization that logo image point to site/images/moolets.gif not finding it.

Anyway, is it possible to change the logo/link to an internal resource (such as a gallery, a static url) or none at all ?

idea: why don't create a unique whole module with all these functionalities selectable from the backend?

A.

thanks for the note, sounds like something got screwed up and I will fix it over the next few days.

The logo is supposed to link back to me so over the years as one forgets where the module came from they can link here for support
