
Wow, I can say that I'm the first one ;) AJAX Post

Posted by armybot - 2007/11/21 16:21

Hi Brian, sorry for bothering you but i noticed some weird using firebug.

If I use your ajax modules with post method they works with IE7 but they shown a "too long request" into firebug (so don't work on firefox).

Viceversa, using Get method, they seem to work but often I found unalignments with real active sessions, for example with total user (lite or not), last avatar and so on...

Furthermore, draggable stuff seems to work only with FF. With IE7, even on your site, I can't have it working...

With IE7 i get tons of js error on your site, too

Any idea?

Thanks,
A.

Hello,
I went to your site and it has what is a common issue for me, you are using shoutbox. You have a version I have not seen before so the issues with that and a moolet on the same page may be fixed, but before they could not share the same page.

I would try just for a moment unpublishing that module and see if the trouble clears up. Then I would turn off that news scroller module and see if it gets even better.

Many times all these widgets conflict with each other.

I was unable to get any Firefox errors myself, I tried serval times.

As Far as the IE thing goes there is a post in the FAQ's about us not supporting IE as that is not where we want to invest out time. Some of the higher end Mootools developers actually block IE from thier sites all together.

I will probably do that in the future as some of the advanced features will never work with that browser.

Let me know what happens after you turn off those modules, if you can still get a Firebug error to show up please take a screen shot and send it as I can not see it. The speed issue depends a lot on your hosts php.ini settings file which unless you have your own dedicated server you have no access to for changing the settings.

Let me know

brian

Found it..
It's my proxy..
I tried via vpn directly and it works perfectly.

I got the IE stuff... I agree but users keep using MS. :S
Anyway, have you idea on how come with GET method I get no errors on firebug but often it doesn't update properly th informations.

Shoutbox works only with GET and firebug shows me its request correctly.

Yours module with GET don't keep alignment with real sessions without showing any errors with firebug.

A.

I don't know what to suggest about the get. If I come across anything I will let you know.

As far as IE goes, I have to deal with the every day as I am a developer by trade because you are right, folks still use it. This project however I do for fun so I just pass the code on to those that can use it or want to work the hell out of it.

thanks
