
Errors

Posted by Epsilon66 - 2007/11/24 17:08

As you can see on my web page, total users mod make severals errors : <http://29mai.eu> (I've several other bugs too to correct from others scripts).

Can, you help me to solve this ?

Thanx in advance ...

Hello,
Looks to me like you are using mootools 1.0 in your site where moolets requires mootools 1.1. If you view your page source you will see this and also you will see you are including the mootools file twice which is very bad. The second include may be wiping out functions instantiated from the first included.

mootools.js would normally be a 1.0 file
mootools.v1.11.js would normally be a 1.1 file

I would use the file we provided in your template and turn off the include in the moolet.

Also I noticed you have "Draggable" turned on. That will cause errors for some folks, you might want to turn that off.

Hope that helps

In fact, I don't know a lot about mootools. the point I've noticed is that if I use 2 different scripts which use their own version of mootools (and it doesn't care if the version number is different), the pages don't work anymore ..

So what I did is to use the same mootools file for all scripts on the website. Which version ? The lastest from mootools. My mootools.js include all componants provided in this page <http://mootools.net/download>

Epsilon66,

If you downloaded the latest from the URL then that is in fact a good thing. The file name does matter greatly to the developer (the cat on my end) with the DOM Debugging tools. I would strongly suggest you rename the file to mootools.v1.11.js. I am very surprised, almost shocked it was not named that way when it came down from mootools.

The I would turn "Off" script include on the moolet, as you have the mootools file in the head of your template. which is also a very good thing. Then with the second file include gone your errors should go away.

If they don't let me know and I will go back and check.

Brian
