
newb - passing parameters to Google API ?

Posted by Bansaw - 2007/12/13 16:52

I want to pass parameters to indicate what zoom level I want to start at, and also that I want my map to be a 'hybrid' map.

How do I do this with the Moolet plugin?
Is it possible?

Thanks (great extension)!

I just realised that the topic below asked a similar question.....:s
I'll have a go at that solution.

Re:newb - passing parameters to Google API ?

This may be useful to others.

I was able to customise the Google API by adding/substituting some parameters:

```
echo "moolet_google_maps.setCenter(new GLatLng(-0.40, 34.67), 11);\n";
```

the new GLatLng () function was substituted for (point) around line 131.

Because Google didn't recognise my "address" (point) , I had to manually find out what Lat/Long it was and convert it to decimal using:

http://andrew.hedges.name/experiments/convert_lat_long/

The "11" is the zoom level which I changed initially from "6")

I changed the "bubble" or "marker" to an address I wanted to display:

```
echo " marker.openInfoWindowHtml('My new addr\, County\, Country');
```

(around line 144)

Also have to change the new GMarker line (around line 137) from "point" to your new GLatLng (.....etc)

Hope this helps.

It seems to work OK!
