---

Hi,

I have this error all the time, on IE7 and FF... I see it in the firefox debug...

And you have it on your website too...

```
this.$events.keys has no properties
http://www.moolets.com/includes/js/mootools.v1.11.js
Line 3
e("load",function())
eval (finction(p,a,c,k,e,d){e=function(c) {return(c
```

syl20  
We have the error because we broke a big rule of web development, NEVER mix javascript frameworks on the same page. You should only see this error on the moolets.com site on the fireboard forums, as fireboard uses a we bit of jQuery on one of the tabs. This does noe play well with the mootools that is also on the page for our moolets.

We have been meaning to remove the jQuery from our forum app but have not found the time.

As far as your site goest, you did not post and avatar and URL so I can only take a guess that you have more then on framework competing on a single page also.

Hi,

Excuse me...

Here is the link <http://livres.o-beez.com>

I don't really understand what you mean... We can't use your module on a page which already have another jquery instructions?

Could you say me what is the problem or the conflict on my page?

I use a cache component (Jrecache) because my website is too long without... And so, i need an ajax online user module for that...

Thanks a lot

Syl20
